1. Premessa

Il presente rapporto tecnico descrive il monitoraggio acustico svolto presso il condominio sito in via Manin 31 a Bologna nel periodo compreso fra il 12 maggio e il 30 giugno 2016.

Tale attività è stata realizzata su richiesta del comune, a seguito di esposti dei residenti per il disturbo prodotto dagli aeromobili in fase di atterraggio all'aeroporto "Guglielmo Marconi".

Si evidenzia il fatto che l'effettuazione di monitoraggi al di fuori della classificazione acustica aeroportuale non permette un riferimento al parametro individuato dalla normativa nazionale per la misura del rumore prodotto da aeromobili, tuttavia il presente monitoraggio è stato richiesto dalla AUSL di Bologna per disporre di un dato utile ai fini di valutazioni sanitarie.

2. Norme e limiti di riferimento

L'inquinamento acustico è regolamentato dalla **Legge Quadro 26/10/1995 n. 447** e dai relativi decreti attuativi, fra cui il **DPCM 14/11/1997** "Determinazione dei valori limite delle sorgenti sonore", il **Decreto 16/3/1998** "Tecniche di rilevamento e misurazione dell'inquinamento acustico" e, per lo specifico rumore di origine aeroportuale, il **DM del 31/10/1997** "Metodologia di misura del rumore aeroportuale" che, oltre ai criteri e modalità di misura del rumore emesso dagli aeromobili nelle attività aeroportuali, disciplina le procedure per l'adozione di misure di riduzione del rumore aeroportuale, per la classificazione degli aeroporti e del loro intorno in relazione al livello di inquinamento acustico e per la determinazione delle caratteristiche dei sistemi di monitoraggio.

Il **DPCM 14/11/1997** indica i **valori limite dei livelli sonori** di qualità, attenzione, emissione ed immissione. I valori limite di immissione sono a loro volta suddivisi in valori assoluti riferiti all'ambiente esterno classificato per destinazione d'uso del territorio, e in valori differenziali riferiti all'ambiente abitativo. L'art. 3, comma 2 stabilisce inoltre che per le infrastrutture stradali, ferroviarie, marittime, aeroportuali e le altre sorgenti sonore di cui all'art. 11, comma 1, legge 26 ottobre 1995, n. 447, i limiti di cui alla tabella C non si applicano all'interno delle rispettive fasce di pertinenza, individuate dai relativi decreti attuativi e che all'esterno di tali fasce dette sorgenti concorrono al raggiungimento dei limiti assoluti di immissione ovvero i limiti stabiliti dalla **classificazione acustica comunale attribuiti in base alla destinazione d'uso del territorio e al periodo di riferimento (diurno 6- 22, notturno 22-6)**.

Per quanto concerne i criteri e le modalità di misura del rumore aeroportuale il **DM 31/10/1997** introduce l'**indice di valutazione LVA** che **esprime l'impronta al suolo delle emissioni sonore prodotte dal sorvolo degli aeromobili ed è quindi indipendente dal contesto della zona interessata e dalla rumorosità caratteristica della stessa**.

Il decreto citato individua il **periodo diurno nell'intervallo compreso fra le 6 e le 23 e il periodo notturno nell'intervallo di tempo compreso fra le 23 e le 6**; l'indice LVA è calcolato su base settimanale.

Relativamente alla caratterizzazione acustica del territorio sono istituite delle aree di rispetto denominate Zona A, Zona B e Zona C.

Al di fuori delle zone A, B e C l'indice LVA non può superare il valore di 60 dB(A) e al contempo il rumore di origine aeronautica deve rispettare, congiuntamente con le restanti sorgenti, i limiti della zonizzazione acustica comunale che, come sopra esposto, ha parametri orari e numerici diversi.

Per quanto concerne la **Zona A**, caratterizzata dai valori di LVA pari o inferiori a 65 dBA non sono previste limitazioni all'uso del territorio. All'interno della **Zona B** (indice LVA compreso fra 65 dBA e 75 dBA) possono insediarsi attività agricole ed allevamenti di bestiame, attività industriali e assimilate, attività commerciali, attività di ufficio, terziario e assimilate previa adozione di adeguate misure di isolamento acustico. All'interno della **Zona C** (indice LVA superiori a 75 dBA) possono svolgersi esclusivamente le attività funzionalmente connesse con l'uso ed i servizi delle infrastrutture aeroportuali. Ad integrazione della normativa nazionale, il comune di Bologna, con delibera del consiglio comunale n. 200 del 13/04/2015 ha approvato la carta unica del territorio in cui vengono individuati, fra gli altri, i vincoli vigenti nell'area sottesa dalla zonizzazione acustica. Nelle aree interessate dagli effetti del rumore aeroportuale, individuate sulla base della zonizzazione elaborata dalla Commissione per il rumore aeroportuale istituita ai sensi del Dm 31 ottobre 1997, non sono consentiti nuovi insediamenti o espansioni degli insediamenti esistenti né cambi di destinazione d'uso verso la funzione abitativa.

Il citato decreto stabilisce inoltre le caratteristiche della strumentazione e delle modalità di misura per la caratterizzazione acustica dell'intorno aeroportuale (sistema di monitoraggio assistito e non assistito).

Il **DM del 20/5/1999** "Criteri per la progettazione dei sistemi di monitoraggio per il controllo dei livelli di inquinamento acustico in prossimità degli aeroporti nonché criteri per la classificazione degli aeroporti in relazione al livello di inquinamento acustico" definisce nel dettaglio le specifiche di un sistema di monitoraggio per il rilievo del rumore di origine aeroportuale, con particolare riferimento alla composizione del sistema stesso, al numero e alle caratteristiche delle stazioni di misura, all'ubicazione di tali stazioni e alle informazioni necessarie al fine di caratterizzare acusticamente ogni singolo evento.

Tale decreto stabilisce inoltre la procedura da seguire in fase di classificazione degli aeroporti in relazione al livello di inquinamento acustico.

Ulteriori disposizioni e attribuzioni di competenze sono riportate nel **DPR dell'11/12/1997**, "Regolamento recante norme per la riduzione dell'inquinamento acustico prodotto dagli aeromobili civili", decreto che prevede limitazioni al traffico aereo notturno (dalle 23 alle 6), nonché una verifica almeno biennale delle emissioni sonore degli aeromobili in esercizio, a cura dell'ente nazionale per

l'aviazione civile.

Il DPR dell'11/12/1997 stabilisce anche che la violazione delle procedure antirumore, rilevata dall'esame dei dati del sistema di monitoraggio di cui al DM 31/10/1997, sia contestata all'esercente dell'aeromobile dal direttore della circoscrizione aeroportuale che provvede alla riscossione delle sanzioni amministrative previste.

L'ente o la società aeroportuale provvede alla gestione e alla manutenzione del sistema di monitoraggio, mentre ARPAE esegue ispezioni periodiche per verificarne l'efficienza ed il rispetto al disposto del decreto.

Infine il **DM del 3/12/1999** "Procedure antirumore e zone di rispetto negli aeroporti" definisce i criteri in base ai quali le commissioni locali previste dal DM 31/10/1997 provvedono alla definizione delle procedure antirumore e alla definizione della classificazione acustica dell'intorno aeroportuale stabilendo i confini delle tre aree di rispetto: Zona A, Zona B, Zona C.

Per determinare il rumore prodotto dal sorvolo degli aeromobili il **DM 31/10/1997** ha introdotto l'**indice di valutazione del rumore aeroportuale LVA** la cui procedura di calcolo viene descritta in **Allegato A** del DM stesso. Come riportato in dettaglio in Appendice 1, l'indice LVA è costruito acquisendo il contenuto energetico dei singoli sorvoli: la normativa prescrive il rilievo in continuo del livello di pressione sonora ponderata con la curva "A" acquisita con costante di tempo *Fast* relativa ai movimenti aerei. Viene richiesto di restituire il valore L_{AFmax} collegato all'evento ovvero *"il livello massimo della pressione sonora in curva di ponderazione "A", con la costante di tempo Fast"*. L'acquisizione di L_{AFmax} è finalizzata al calcolo del SEL (Sound Exposure Level) che deve essere svolto per tutti gli eventi acquisiti e compresi tra il valore di L_{AFmax} e il valore di L_{AF} superiori a $L_{AFmax} - 10dB$. Il calcolo del SEL ottenuto nel modo indicato dal decreto, può comportare sia delle sottostime sia delle sovrastime del SEL.

I livelli sonori riferiti a tali eventi vengono distribuiti sugli interi periodi di riferimento diurno (LVAd) e notturno (LVAn) al fine di ottenere un valore giornaliero del livello di valutazione del rumore aeroportuale (LVAj), ed infine costruire l'indice sulla base di 21 LVAj ricavati dalla settimana peggiore per ciascuno dei tre periodi 1 ottobre - 31 gennaio, 1 febbraio - 31 maggio; 1 giugno - 30 settembre.

Per effettuare il calcolo di tale indice occorre dunque disporre dei dati dell'intero anno sulla base dei quali individuare le tre settimane peggiori dal punto di vista del traffico. A tale proposito si evidenzia che potendo verificare solo le tre settimane di maggior traffico ed essendo l'LVA giornaliero fortemente influenzato dai voli notturni la cui presenza comporta la penalizzazione di 10 dB(A) non è detto che ai periodi con il maggior numero di voli corrispondano gli LVA maggiori.

3. Il sistema di misura del rumore aeroportuale di SAB

Il calcolo dell'indice di valutazione del rumore aeroportuale LVA, secondo quanto disposto dal DM 30/10/1997 e dal DM 20/5/1999, viene fatto sulla base dei dati rilevati dal sistema di monitoraggio del rumore aeroportuale. Tale sistema, gestito da SAB e sottoposto a controlli periodici da parte di ARPAE, è strutturato in modo da monitorare le operazioni di decollo ed atterraggio e registrare in continuo i dati degli eventi sonori per lo di pressione sonora ponderata "A" con costante di tempo *Fast*.

I dati rilevati dalle singole stazioni, corrispondenti agli eventi estratti sulla base delle soglie temporali e di livello, sono trasmessi, gestiti ed elaborati presso il centro di controllo in cui avviene la correlazione automatica al traffico aereo sulla base delle tracce radar fornite dall'ente nazionale di assistenza al volo. Le stazioni di monitoraggio sono costituite da un terminale di rilevamento (microfono per esterni di classe 1) collegato ad un box in cui trovano alloggio fonometro/analizzatore di frequenza in tempo reale di classe 1 e computer che acquisisce e memorizza i dati rilevati fino al trasferimento giornaliero su apposito server, mediante collegamento con rete UMTS.

Le stazioni di monitoraggio, per ogni singolo evento riconosciuto, restituiscono data, ora e durata dell'evento, correlazione con traccia radar (o eventuale correlazione manuale) unitamente a SEL, L_{Aeq} e L_{AFmax} dello stesso.

L'insieme degli eventi riconosciuti e considerati correlati costituisce la base per il calcolo dell'LVA.

4. Monitoraggio ARPAE

Il monitoraggio è stato svolto posizionando la strumentazione sul lastrico solare dell'edificio che comprende il civico 31 di via Manin. Tale edificio presenta uno sviluppo verticale di quasi 40 m (10 livelli fuori terra + portico) ed è situato in una zona a prevalente uso residenziale. Le sorgenti sonore che influiscono sul clima acustico dell'area sono il traffico aereo in atterraggio lato città e la viabilità stradale.

L'area, esterna alla classificazione acustica aeroportuale, in base alla zonizzazione acustica del Comune di Bologna risulta essere classificata in classe IV con i seguenti limiti di immissione: 65 dB(A) per il periodo diurno, 55 dB(A) per il periodo notturno.

Il sito di misura è ubicato a circa 4 km dall'aeroporto, e risulta praticamente in linea alla pista, di conseguenza gli aerei in atterraggio transitano sopra il condominio generando eventi rilevanti, mentre gli aerei in decollo sono acusticamente difficilmente riconoscibili e non significativi rispetto agli atterraggi in quanto cominciano la virata molto prima.

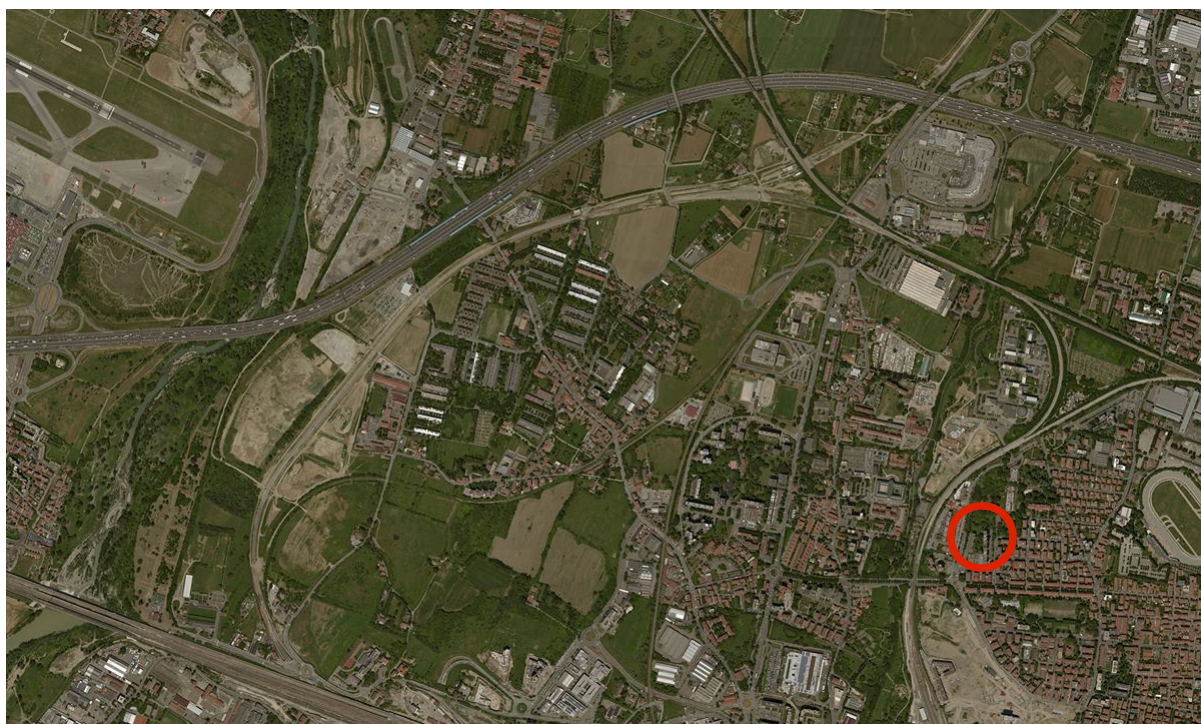

Figura 4.1. Localizzazione del sito di misura

Figure 4.2. e 4.3. Strumentazione Arpae presso il condominio di via Manin 31.

Le misure sono state eseguite impiegando strumentazione di classe 1, così come prescritto dal DM 16/3/1998, decreto attuativo della L. n. 447 del 26/10/1995, tutta in regolare corso di taratura biennale, elencata di seguito: Fonometro 01dB SOLO n. 65154 dotato di capsula microfonica 01 dB MCE n. 134834 e preamplificatore 01dB PRE21 n. 15575; Calibratore 01dB CAL 21 n. 50241558.

La strumentazione è stata impostata per acquisire livelli di pressione sonora con costante di tempo *Fast* e restituire uno "short Leq" ponderato con curva "A" ogni secondo.

L'unità microfonica è stata accessoriata con protezione per esterni adeguata a garantire protezione prolungata nel tempo nei confronti degli eventi atmosferici.

Il box per esterno a tenuta stagna è stato posizionato il 12 maggio 2016 e ritirato il 30 giugno 2016.

Nel corso di questo periodo si sono verificate condizioni meteorologiche non sempre favorevoli con precipitazioni e vento superiore a 5 m/s.

Inoltre si sono verificati alcuni cali di batteria in corrispondenza dei quali non si è avuta acquisizione dei dati.

Nel corso del monitoraggio si è provveduto alla verifica periodica della stabilità della strumentazione ottenendo differenze nella calibrazione non superiori a 0,5 dB(A).

L'elaborazione dei dati è stata svolta con l'impiego del software dBTrait32 v. 4.021.

5. Risultati

In fase di elaborazione si è ricavato il livello di immissione globale presso il sito oggetto di monitoraggio, relativo ai periodi diurni e notturni. Tale livello è determinato dall'insieme di tutte le sorgenti di rumore presenti.

I valori ottenuti sono riportati in Tabella 5.1. unitamente al numero di atterraggi per pista 30 (sulla città). In tale tabella sono evidenziati i livelli misurati in periodi con precipitazioni e/o vento superiore ai 5 m/s ovvero in condizioni non rispondenti alle norme tecniche di cui all'allegato B del DPCM 16/3/1998.

In base all'analisi della storia temporale acquisita è stata individuata una soglia per il livello pari a 62 dB(A) per una durata non inferiore a 6 s che consentisse di isolare gli eventi corrispondenti ai transiti di aeromobili; tale procedura ha carattere automatico ed è possibile che non tutti gli eventi estratti in questo modo siano ascrivibili agli atterraggi per pista 30; tali dati sono riportati in Appendice 3.

Per questo motivo, in corrispondenza dei periodi con superamento dei limiti della classificazione acustica comunale, si è provveduto ad una verifica puntuale dei singoli eventi sonori sulla base dei tabulati del traffico aereo forniti da SAB. Tale controllo ha mostrato che la procedura di estrazione automatica evidenzia tutti gli atterraggi su pista 30 e può comprendere anche eventi non riconducibili al traffico aereo. I dati corrispondenti sono riportati per esteso in Appendice 4.

A partire dal contenuto energetico degli eventi sonori individuati automaticamente sono stati calcolati i

livelli equivalenti sui periodi diurno e notturno ascrivibili agli atterraggi per pista 30; i risultati sono riportati in Tabella 5.1 di cui si riporta la descrizione:

Leq D/N: livello equivalente globale comprendente tutte le sorgenti sonore avvertibili nel punto di misura suddiviso in diurno (6-22) e notturno (22-6), i limiti di riferimento sono quelli di cui alla zonizzazione acustica comunale che per l'area in questione di classe IV risultano essere di 65 dB(A) per il periodo diurno e 55 dB(A) per quello notturno.

Le sigle P e V indicano la presenza in tale periodo di pioggia (P) per precipitazioni pari o superiore a 3 mm durante tutto il periodo considerato, o vento (V) superiore a 5m/s presente per almeno il 25% del tempo che compone il periodo.

Leq aerei: Livelli equivalenti degli interi periodi diurni e notturni considerando il solo contributo dei velivoli che hanno prodotto l'evento acustico con atterraggi per pista 30 (lato Bologna); i limiti di riferimento sono quelli di cui alla zonizzazione acustica comunale che per l'area in questione di classe IV risultano essere di 65 dB(A) per il periodo diurno e 55 dB(A) per quello notturno.

LVA d/n: Indice di valutazione del rumore aeroportuale diurno e notturno, valori utili al solo fine di costruire l'indice di valutazione giornaliero. I periodi diurni e notturni per il calcolo del Leq e dell'LVA discordano di 1 ora.

LVAJ: Indice di valutazione giornaliero (v. appendice 1), il singolo valore non può essere riferito ai limiti di legge in quanto serve per costruire il parametro di legge sommando i 7 LVAj dei 7 giorni caratterizzato dal maggior traffico per quadrimestre.

A30: numero di eventi/atterraggi avvenuti in pista 30 e pertanto transitati sopra il condominio oggetto del monitoraggio.

Tabella 5.1

6. Valutazioni e conclusioni

Il presente monitoraggio è stato eseguito al fine di valutare il clima acustico presso lo stabile di via Manin 31, particolarmente influenzato dagli aerei in atterraggio.

L'analisi dei livelli ottenuti evidenzia che durante il monitoraggio i limiti di zona sono stati sempre rispettati nel periodo di riferimento diurno e che relativamente al periodo di riferimento notturno risultano 6 lievi superamenti del limite di 55 dB(A) su 36 notti monitorate a fronte di 12 notti interessate da atterraggi su pista 30, al lordo delle condizioni meteo non conformi al d.M.16/03/1998;

Negli stessi giorni in cui viene superato il limite della classificazione acustica nel periodo notturno si verifica anche un innalzamento dell'indice LVAj oltre i 60 dB(A) a causa della presenza di atterraggi oltre le 23.00 che comportano la penalizzazione automatica di 10 dB(A) nell'indice di valutazione notturno. Tale superamento della soglia dei 60 dB(A) come LVAj costituisce un indice di rischio in relazione al superamento dei limiti normativi, in quanto l'eventuale ripetersi di tali valori superiori a 60 dB(A), nelle settimane prese a riferimento, ovvero con maggior traffico, porterebbe ad una violazione ai termini di legge.

Un altro elemento che è stato valutato è la corrispondenza logica dei valori registrati dalla centralina rilocabile di cui al presente monitoraggio, da quelli restituiti dalla stazione n. 6 del sistema di monitoraggio aeroportuale ubicata presso il centro sportivo Pizzoli di via Agucchi, fermo restando che le 2 stazioni di monitoraggio distavano circa 1800 metri.

Si sono pertanto individuati 5 periodi notturni con presenza di atterraggi in pista 30 al fine di individuare senza possibilità di errore gli eventi acustici registrati da entrambe le centraline che è stato possibile assegnare allo stesso evento aeronautici.

Il confronto di tali valori è rappresentato nella tabella 5.2 la quale evidenzia che la centralina di monitoraggio permanente di via Agucchi registra valori di SEL superiori di circa 2 dB(A) alla centralina ARPA, come era lecito aspettarsi.

DATA	ORA	DURATA		LAEQ EVENTO		DIFFERENZA ARPA-SAB	SEL		DIFFERENZA ARPA-SAB
		ARPA	SAB	ARPA	SAB		ARPA	SAB

Tabella 5.2

In sintesi il contributo dovuto agli eventi aerei selezionati mostra che gli atterraggi su pista 30 influenzano notevolmente il livello acustico presso il sito monitorato. Non è possibile tuttavia con i dati acquisiti nel presente monitoraggio dire se il contributo all'inquinamento acustico sia tale da generare il superamento dei limiti di LVA di 60 dB(A) nelle tre settimane di maggior traffico come prescritto dalla norma. Un eventuale superamento sarebbe favorito dal numero di aerei in atterraggio in pista 30 nelle suddette settimane nel periodo notturno. Occorre tuttavia tenere presente che il sito di misura risente in modo marginale dei decolli in pista 12 che invece forniscono il maggiore contributo all'indice di esposizione che si forma presso la centralina n. 6, stazione maggiormente rappresentativa del rumore prodotto dall'aeroporto.

Appendice 1. L'indice di valutazione del rumore aeroportuale

Il DM 31/10/1997 (allegato A) per valutare il rumore prodotto dal sorvolo degli aeromobili introduce l'indice di valutazione del rumore aeroportuale LVA definito dalla seguente espressione

$$L_{VA} = 10 \log \left[\frac{1}{N} \sum_{j=1}^N 10^{\frac{L_{VAj}}{10}} \right] dB(A)$$

in cui:

LVA rappresenta il livello di valutazione del rumore aeroportuale;

N è il numero dei giorni del periodo di osservazione del fenomeno pari a 21 ovvero tre settimane aventi il maggior numero di movimenti in relazione ai periodi 1 ottobre - 31 gennaio, 1 febbraio - 31 maggio, 1 giugno - 30 settembre;

LVAj è il valore giornaliero del livello di valutazione del rumore aeroportuale che si determina considerando tutte le operazioni a terra e di sorvolo che si manifestano nell'arco della giornata compreso tra le ore 0 e le 24, acquisendo, a partire da rilievi in continuo, il contenuto energetico dei singoli sorvoli.

L'espressione per il calcolo dell'indice LVAj è la seguente

$$L_{VAj} = 10 \log \left[\frac{17}{24} 10^{\frac{L_{VAjd}}{10}} + \frac{7}{24} 10^{\frac{L_{VAjn}}{10}} \right] dB(A)$$

dove

$$L_{VAjd} = 10 \log \left[\frac{1}{T_d} \sum_{i=1}^{N_d} 10^{\frac{SEL_i}{10}} \right] dB(A)$$

è il livello di valutazione del rumore aeroportuale nel periodo diurno (LVA_d) in cui T_d = 61200s (17 ore), N_d è il numero totale dei movimenti degli aeromobili in tale periodo e SEL_i è il livello dell'iesimo evento sonoro associato al singolo movimento;

$$L_{VAjn} = \left[10 \log \left(\frac{1}{T_n} \sum_{k=1}^{N_n} 10^{\frac{SEL_k}{10}} \right) + 10 \right] dB(A)$$

è il livello di valutazione del rumore aeroportuale nel periodo notturno (LVA_n) in cui T_n = 25200s (7 ore), N_n è il numero totale dei movimenti degli aeromobili in tale periodo, SEL_k è il livello sonoro del k-esimo evento associato al singolo movimento.

Il livello dell'evento sonoro associato al singolo movimento di aeromobili SEL è determinato dalla seguente relazione

$$SEL_i = 10 \log \left[\frac{1}{T_0} \int_{t_1}^{t_2} \frac{P_{A_i}^2(t)}{P_0^2} dt \right] = \left(L_{AeqT_i} + 10 \log \frac{T_i}{T_0} \right) dB(A)$$

in cui T₀ = 1 s è il tempo di riferimento; t₁ e t₂ rappresentano gli istanti iniziale e finale della misura, ovvero la durata dell'evento T_i = (t₂ - t₁) in cui il livello LA risulta superiore alla soglia LAF_{max} - 10 dB(A); P_{Aj}(t) è il valore istantaneo della pressione sonora dell'evento iesimo ponderata A e P₀=20μPa rappresenta la pressione sonora di riferimento; LAeqT_i è il livello continuo equivalente di pressione sonora ponderata A dell'i-esimo evento sonoro; LAF_{max} è il livello massimo della pressione sonora in curva di ponderazione "A", con la costante di tempo "Fast" collegato all'evento.

Appendice 2. Eventi estratti
